Education

Wuhan Huaxia Institute of Technology Wuhan, China

Computer Science and Technology (B.Eng.) *Sep. 2022 – Jun. 2026*

- GPA: 3.7/5 | Average Score: 86.7/100
- Relevant Coursework: Advanced Mathematics (90), Discrete Mathematics (97), Data Structures and Algorithms (93), Operating System (91), Computer Networks (89), Computer Organization (92), Embedded System (91), etc.

Work Experience

KodeRover | Zadig (3.3k GitHub Stars)

Golang Backend Developer *Mar. 2026 – Jul. 2026*

- Merged 28 PRs across workflow execution, RBAC, OpenAPI, host Agent, and releases for KodeRover's cloud-native DevOps platform Zadig. Stack: Go, Gin, MongoDB, MySQL, Kubernetes, Helm, and APISIX.
- Implemented serial/parallel DMS Job execution, APISIX output variables, dynamic parameter rendering, required-field validation, debug metric isolation, Pod event collection, cross-Job variables, and failure diagnosis.
- Added environment/production scaling, read-only, and operation-log RBAC permissions; implemented API authorization, role-action models, SQL initialization, and 4.3/5.0 migration compatibility.
- Extended Pod queries and restarts, host-Agent version-drift detection, login time, environment aliases, cluster-aware YAML, snapshots/rollback, and unified auth, License checks, and audit logs.
- Led Zadig upgrades and traced customer issues across APIs, workflows, and releases.

Internship Experience

Shanghai Jianwen Investment Management Co., Ltd.

Golang Backend Intern *Oct. 2025 – Jan. 2026*

- Built low-latency crypto trading flows for accounts, orders, real-time market data, and positions. Stack: Go, Binance Futures API, WebSocket, DolphinDB, Docker, and Pulse.
- Integrated Binance Futures API for accounts, concurrent orders/cancels, and real-time positions.
- Subscribed to Aggregate Trade via WebSocket and aggregated 1-minute candles with a worker pool.
- Used DolphinDB's matching engine and stream tables to cut market-data latency from about 3000 ms to 100–300 ms, a roughly 10x improvement.
- Deployed streaming, trading, and DB services with Docker; built PnL, position, and order dashboards in Pulse.

Shanghai Zhi'anhua Digital Technology Co., Ltd.

AI Agent Developer *Jun. 2025 – Sep. 2025*

- Participated in developing a Web automation testing and data analytics system using advanced browser automation to achieve efficient data collection, processing, and analysis, providing technical support for business staff.
- Developed a multi-dimensional spreadsheet integration SDK for Lark, enabling real-time data storage, synchronization, and management.
- Built a complete automated data processing workflow for Lark, achieving end-to-end automation of data flow.
- Integrated the Google Gemini API to build an intelligent data analysis system, providing in-depth data insights.
- Built an RAG API SDK based on ByteDance's Eino framework. Source code available on GitHub.

Projects

Gorder | *Source code available on GitHub* Feb. 2025 – May 2025

- Built a distributed e-commerce order system with Stripe payment and callback verification. Stack: Go, Gin, gRPC, Consul, RabbitMQ, MySQL, MongoDB, Redis, OpenTelemetry, Prometheus, and Docker Compose.
- Connected order, inventory, payment, and kitchen via HTTP, gRPC, and RabbitMQ for async Stripe payment.
- Combined Redis SETNX and MySQL pessimistic locks to prevent overselling under concurrent stock deduction.
- Added ACK/NACK, retries, DLQs, and OpenTelemetry context for reliable order/payment events and tracing.
- Added Consul discovery, Prometheus/Jaeger observability, OpenAPI/Protobuf clients, and Docker Compose orchestration.

Gitlet | *Source code available on GitHub* Oct. 2023 – Nov. 2023

- Designed and implemented a core version control system, replicating essential Git functionalities including `add`, `commit`, `checkout`, `branch`, `merge`, and others.
- Managed persistent storage of repository objects (commits, blobs, and trees) and references (branches and HEAD) using file system operations.
- Applied advanced data structures (e.g., hash maps and graph representations for commit history) and BFS/DFS algorithms (e.g., graph traversal for `log` and lowest common ancestor for `merge`) for efficient state management.

Open Source Experience

Oasisdb - Vector Database | *Contributor (PR Merged)*

- Issue: add flat index, which is very simple, stores each vector, and retrieves it by brute force.
- PR Content: Designed and implemented `FlatIndex`, a simple brute-force vector index that stores vectors and retrieves them by linear scan.
- Completed unit tests ensuring correctness, stability, and compliance with the existing `VectorIndex` interface.

Skills

Languages: Mandarin (Native); English (B2)
Development Tools: Git, Docker, Kubernetes, Makefile, Markdown, Linux Command
Design Patterns: Practical experience with Factory, Singleton, and Adapter in personal projects.
AI-Assisted Development: OpenAI Codex, Claude Code, MCP (Model Context Protocol), agentic coding workflows, reusable AI skills, and AI-powered tool integration.
Database: Familiar with MySQL SQL statements, transactions, query optimization strategies, Redis, and MongoDB.
